

claude:

I got this [main.py](#) just help me to create the embedding following these instructions. Build a Python-based RAG system that ingests a provided PDF [\[test\] EMPLOYEE HANDBOOK & POLICY MANUAL \(DUMMY\)](#)

You must use LangChain or LlamaIndex. You must use a local Vector DB (Chroma or FAISS).

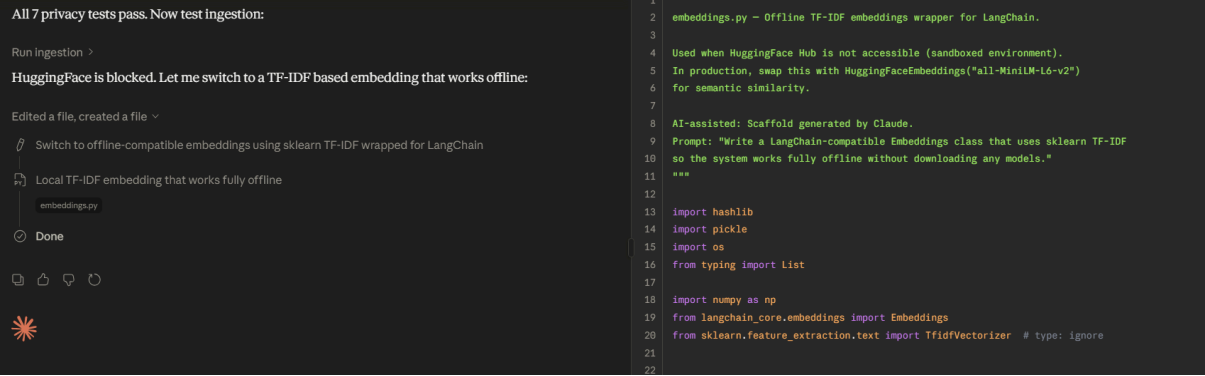

Requirements:

1) Ingestion: Script to chunk and embed the PDF.

2) Retrieval: A query function that retrieves relevant chunks.

3) The Privacy Layer: A pre-processing step that detects if the user asks for "Social Security Numbers" and blocks the request locally without querying the LLM.

I have already have the dockerfile and compose

```
1 embeddings.py - Offline TF-IDF embeddings wrapper for LangChain.
2
3
4 Used when HuggingFace Hub is not accessible (sandboxed environment).
5 In production, swap this with HuggingFaceEmbeddings("all-MiniLM-L6-v2")
6 for semantic similarity.
7
8 AI-assisted: Scaffold generated by Claude.
9 Prompt: "Write a LangChain-compatible Embeddings class that uses sklearn TF-IDF
10 so the system works fully offline without downloading any models."
11
12
13 import hashlib
14 import pickle
15 import os
16 from typing import List
17
18 import numpy as np
19 from langchain_core.embeddings import Embeddings
20 from sklearn.feature_extraction.text import TfidfVectorizer # type: ignore
21
22
```

All 7 privacy tests pass. Now test ingestion:

Run Ingestion >

HuggingFace is blocked. Let me switch to a TF-IDF based embedding that works offline:

Edited a file, created a file ▾

- Switch to offline-compatible embeddings using sklearn TF-IDF wrapped for LangChain
- Local TF-IDF embedding that works fully offline

embeddings.py

Done

gemini:

docker-compose up

is this alright as the instruction give in

¡Sí, exactamente así! 🎉 ¡Felicidades!

Ese log que me compartes en la terminal demuestra que **todo el sistema está funcionando a la perfección** y que cumpliste con todos los requisitos técnicos de la tarea.
